LITERATURE REVIEW

No.	Project Title	Problem	Approach	Pros	Cons
1.	Artificial intelligence, machine learning, and deep learning for enhancing managerial productivity and task efficiency.	Time-consuming manual, large amount of structured data, inefficient workflow.	NLP-Natural language Processing, deep learning, MLOPs, LLMOPSS.	More time saved, better workflow, increased accuracy, communication is improved.	Risk of security, concerns privacy, employee training is required.
2.	The mediating role of self-control in the relationship between internet addiction and academic procrastination among high school students	Students these days have very low self control, they are addicted to their phones which causes	To develop students self control through training, help students understand the benefits of long-term hard work.	Reduces procrastination, Improves students grades, increases self-discipline, long-term	It will take time for students to reduce their screen time and stop procrastinating.

		procrastination.		goal achievement.	
3.	Procrastination Root Cause Identifier: A Dual-Model AI-Driven Conversational Framework for Multi-Factor Behavioural and Psychological Analysis	Procrastination which is influenced by psychological disorders such as anxiety and depression.	BERT Deep Learning Model, Machine Learning Model, Provides crisis-support messages.	Easy to use, protects user privacy, suitable for students, provides good guidance.	Not a clinical diagnosis tool, Needs updates, Limited by dataset quality.
4.	Understanding Procrastination as Habitual Pattern in ESL Classrooms: An NLP intervention study	Academic procrastination among undergraduate ESL students	Identify the cause of negative thoughts in students.	Reduces fear of failure, helps students think more positively about themselves.	The sample size is small since there were only 30 students, NLP in education is still debated.
5.	Emotional attitudes towards procrastination in people: A large-scale sentiment-focused crawling analysis	Lower productivity and well-being, Negative emotions and poor self-regulation	Collect multiple social media posts related to procrastination and analyse that information.	Uses a huge dataset, provides more reliable results, better understanding of human behaviour.	Social media can sometimes be fake, some information can be incomplete, it can hurt people's emotions.
6.	The Role of Deadlines in English Language Learning: Between Motivation, Procrastination, and Learner Self-Regulation	Most students delay working on submissions till deadlines, reduces academic	Use reminders such as planners, calendars, students should create a practical and simple study	Deadlines help students stay motivated, they have a sense of responsibility	Students still procrastinate after having deadlines, exams create a lot of pressure for students,

	among Students of Technical Specialties	performance, Poor self-regulation	schedule a week before their exams start.	y, supports long-term learning habits.	they have a huge fear of failure.
7.	Reddit Depression Communities as Spaces of Emotion Regulation: A Data-Informed Analysis of Coping and Engagement	Determine if language used by people in social media rants can reveal different coping strategies, psychological engagement levels and distinct emotional profiles.	Use social media apps such as Reddit that provide continuous real-world observations to conclude how people cope, how engagement changes over time and what recovery stages look like from online	Large Scale Reddit data reflects meaningful psychological states. Very large dataset with multiple emotional features instead of relying on sentiment.	No clinically verified depression diagnoses. Limited since it is only based on Reddit users. Observational study.
8.	Patterns of Student Writing Across Time: The Dynamic Temporal Relationships Between Anxiety and Procrastination	It tells if anxiety actually leads to procrastination	To conduct a meta-analysis of anxiety, analyse students writing pattern over time.	Uses google-docs for high resolution tracking, provides more accurate evidence about procrastination.	Raises privacy and security concerns, may not generalise to all students, may not capture all emotions.
9.	Emotional attitudes towards procrastination in people: A large-scale sentiment-focused crawling analysis	Answering the question whether procrastination is positive or negative for an individual.	Instigates people's emotional attitudes toward procrastination using large scale social	Extremely large dataset. Multi-platform social media analysis. Uses real	Social media users may not represent the general public. Analysis may interpret

			media data and Natural Language Processing.	world behaviour rather than questionnaires and surveys.	sarcasm or context.
10.	Profiles of Academic Procrastination in Higher Education: A Cross-Cultural Study Using Latent Profile Analysis	Do procrastinators view procrastination positively or negatively?	Data collected from 488,601 users and 18.8 million posts from social media	A huge dataset was used, emotions could predict procrastination,	Only social media users were studied, cultural bias can lead to faulty data.
11.	Stress Detection on Social Network: Public Mental Health Surveillance	Traditional methods of measuring stress have limitations like time consuming surveys, small sample sizes, subjective assessments.	Proposes a Supervised Machine learning framework for large scale stress detection using Twitter.	Compares multiple ML algorithms, employs standard evaluation metrics and cross-validation.	Search keywords changed during data collection - created inconsistencies. Relatively small dataset. Models trained on Reddit may not fully generalise to Twitter or Facebook.
12.	Patterns in assignment submission times: Procrastination, gender, grades, and grade components	The main problem is how procrastination is done, by cognitive or non-cognitive; by gender and factors affecting it.	Timestamps taken from 1,218 students, Used Latent Profile Analysis (LPA) to divide into groups of 4.	Identifies four different procrastination patterns, shows early completion is related to higher grades.	Conducted only in one university, so dataset is small; Completion time alone cannot explain why

					students procrastinate.
13.	Exploring the dynamic nature of procrastination: A latent growth curve analysis of academic procrastination	Procrastination is very common among college students, study investigates whether procrastination is a fixed personality trait or a dynamic behavior that changes over time	Measured procrastination multiple times throughout the semester instead of only once, Used Latent Growth Curve Modeling (LGCM) to analyze how procrastination changes over time.	LGCM is very detail oriented and accurate, shows procrastination is context-dependent.	Even though LGCM identifies patterns, it cannot completely prove cause-and-effect relationships.
14.	Classifying Causes Of Depression From Social Media Posts Using Machine Learning and NLP	Cause-based depression classification from social media	Most existing depression detection systems only determine whether a user is depressed, this research identifies the underlying cause of depression expressed in social media posts.	Moves beyond simple depression detection to cause based identification , combines supervised and unsupervised learning, provides a framework for public health monitoring using social media.	The dataset is small. Overlap between emotions making single-labeled classification unrealistic. Twitter language is noisy with slang, abbreviations and figurative expressions - reducing classification accuracy.
15.	Academic procrastination: The	Procrastination is a	Helps in identifying	Uses objective	It does not include

	pattern and correlates of behavioural postponement	common habit leading to stress, poor grades, and ineffective learning.	procrastinators early, improves self-regulation.	behavioral data, shows importance of planning, shows how it influences student behaviour.	personal reasons like stress, health, or family issues.
